ValenbiciJDG Project

Resumen del Proyecto

ValenbiciJDG is a Java-based web application that provides real-time information about Valenbisi bicycle stations in Valencia, Spain. The project integrates with the Valencia City Council geospatial API to retrieve station data, including location, bicycle availability, free anchor points, and operational status. It features a bilingual (Spanish/English) web interface with two main pages: a list view displaying all stations in a table format, and an interactive map using Leaflet.js that shows station markers color-coded by availability. The backend handles coordinate conversion from EPSG:25830 to WGS84, stores data in JSON format, and connects to a MySQL database for persistent storage. The project aims to promote sustainable urban mobility by making real-time bike-sharing data accessible and easy to use for citizens and visitors in Valencia.

Glosario

English	Español	Definition
Station	Estación	A fixed location where Valenbisi bicycles are parked and available for rent.
Availability	Disponibilidad	The number of bicycles currently available for use at a station.
Free anchor points	Anclajes libres	Empty docking slots where bicycles can be returned.
API	API	Application Programming Interface; allows the application to retrieve data from external services.
Leaflet.js	Leaflet.js	An open-source JavaScript library used to display interactive maps.
JSON	JSON	JavaScript Object Notation; a lightweight data format used to store and exchange information.
Real-time	Tiempo real	Data that is updated immediately as conditions change.
Marker	Marcador	An icon on the map representing a station location.
Popup	Popup	A small window that appears when clicking a marker, showing station details.
Sustainable mobility	Movilidad sostenible	Transportation methods that reduce environmental impact.

Bike-sharing	Bicicleta compartida	A service where bicycles are available for shared use at various stations.
